Physical and Digital Security 4.0

DEFENSE

We are involved in designing a tailored 4.0 framework to seamlessly integrate physical operations with advanced digital solutions.

We have adopted a double diamond process starting with the discovery phase: assessment of all the existing digital and physical assets that play a role in the security domain and highlighting all the characteristics of what is already in field.

As a next step we have moved to define phase: the process of creating a proper framework of tools and procedures. Both technological and economic constraint has been taken in account during the define phase.

The project involved 4 different location: the HQ and other three production plants.
